1325 NW 78th Ave, Suite 101  
Doral, FL 33126  
305.477.3032  
[www.clarcompany.com](http://www.clarcompany.com)

## Warranty & limitations

All products presented herein are warranted to the buyer to be free from defects in material and workmanship. The foregoing warranty is non-assignable and in lieu of and excludes all other warranties not expressly set forth herein, whether express or implied by operation of law or otherwise, including but not limited to any implied warranties of merchantability or fitness for a particular purpose. All details and specifications presented herein are intended as a general guide for the use of Clar Company products. These products should not be used without evaluation by a qualified engineer or architect to determine their suitability for a specific use.

Clar Company assumes no responsibility for failure resulting from use of its details or specifications, or for failure resulting from improper application or installation of these products.

# GENERAL PRODUCT INFORMATION

## STIFFENING LIP LENGTH

Section	Flange Width	Design Stiffening Lip Length (in)
S125	11/4"	0.188

## STEEL THICKNESS TABLE

Designation Thickness (Mils)	Minimum Thickness <sup>1</sup> (in)	Design Thickness (in)	Design Inside Corner Radii <sup>2</sup> (in)	Reference Gauge No.	Minimum Coating
18	0.0179	0.0188	0.0844	25	G40
27	0.0269	0.0283	0.0796	22	G40
30	0.0296	0.0312	0.0782	20-Drywall	G40

<sup>1</sup> Minimum Thickness represents 95% of the design thickness and is the minimum acceptable thickness delivered to the job site based on section A2.4 of the AISI S100-12.

<sup>2</sup> The tables in this catalog are calculated based on inside corner radii listed in this table.

## Definitions of Structural Property Symbols

### Gross Properties

- Ix: Moment of inertia of gross section about the X-X axis (strong axis).  
Sx: Section modulus about the X-X axis (strong axis).  
Rx: Radius of gyration of the gross section about the X-X axis.  
Iy: Moment of inertia of gross section about the Y-Y axis (weak axis).  
Ry: Radius of gyration of the gross section about the Y-Y axis.

### Effective Properties

- Ixe: Effective moment of inertia about the X-axis.  
Sxe: Effective section modulus about the X-X axis (strong axis) stress = Fy.  
Ma: Allowable Bending Moment - Based on the effective section modulus and the allowable stress including the strength increase from the cold-work of forming (Section A7.2) where applicable.  
Mad: Allowable Bending Moment - Based on Distortional Buckling Strength calculated per AISI section C3.1.4  
Vag: Allowable strong axis shear away from punchout, calculated in accordance with AISI Section C3.2.1.  
Vanet: Allowable strong axis shear at punchout, calculated in accordance with AISI Section C3.2.2.

### Torsional and Other Properties

- J: St. Venant Torsional Constant.  
Cw: Torsional warping constant.  
m: Distance from shear center to mid-plane of web.  
Xo: Distance from the shear center to the centroid along the principal X-axis. Ro: Polar radius of gyration about the centroidal principal axis.  
b:  $1-(Xo/Ro)^2$   
Lu: The longest weak axis (Ly) and torsional (Lt) unbraced length at which lateral torsional buckling is restrained in accordance with AISI C3.1.2.1.

## General Notes for all Tables

1. Where AISI S100-12 is referenced, it is the "North American Specification for the Design of Cold-Formed Steel Structural Members", 2012 Edition, with US provisions.
2. The strength increase from cold work of forming has been incorporated for flexural strength per Section A7.2 of AISI S100-12.
3. The effective moment of inertia for deflection is calculated at a stress which results in a section modulus such that the stress times the section modulus at that stress is equal to the allowable moment. AISI S100-12 Specification Procedure 1 for serviceability determination has been used. Increases in the effective moment of Inertia ( $I_{xe}$ ) may be possible at lower stress levels. Any modified values would be required to be calculated by a qualified engineer.
4. Various sections may be manufactured with yield points of 33 or 50 ksi. The yield point used for calculations are listed in the tables.
5. For sections available in both 33 and 50 ksi, the specifier must clearly indicate which yield point is required. For example: 362S162-68 (50ksi).
6. When provided, factory punchouts will be located along the centerline of the webs of the members and will have a minimum center-to-center spacing of 24 inches. Punchouts for members greater than 2.5 inches deep are a maximum of 1.5 inches wide x 4 inches long. Members with depths 2.5 inches and smaller are a maximum of 3/4 inches wide x 4 inches long.

## Section Properties Table Notes

1. Calculated properties are based on AISI S100-12, "North American Specification for the Design of Cold-Formed Steel Structural Members."
2. The centerline bend radius is based upon inside corner radii shown in the general notes for all tables.
3. Effective properties incorporate the strength increase from the cold work of forming as applicable per AISI A7.2.
4. Tabulated gross properties, including torsional properties, are based upon full-unreduced cross section of the studs, away from punchouts.
5. For deflection calculations, use the effective moment of inertia.
6. Allowable moment includes cold-work of forming.
7. For the steels that have both 33 and 50 ksi listing, if the design is based upon 50 ksi, the 50 ksi steel needs to be specified. (Example: 362S137 16-50 (50 ksi)).
8. Web depth for track sections is equal to the nominal stud width plus 2 times the design thickness plus the bend radius. Hems on nonstructural track sections are ignored.

## Nomenclature

### MEMBER DEPTH:

All member depths are taken in 1/100 inches. For all "T" Sections, member depth is the inside to inside dimension.

### FLANGE WIDTH:

All flange widths are taken in 1/100 inches.

### YIELD STRENGTH Fy (ksi)

### COATING

600	S	162	33	33 ksi	NS	G40	TAG
-----	---	-----	----	--------	----	-----	-----

### STYLE:

The five alpha characters utilized by the designator system are:  
S = Studor Joist Sections  
T = Track Sections

### MATERIAL THICKNESS:

Material thickness is the minimum base metal thickness in mils.  
Minimum base metal thickness represents 95% of the design thickness.

### NON STRUCTURAL

Is a required marking on individual non structural studs

### RAW MATERIAL TAG

For more information, please contact Clar Company at **305.477.3032**
